

Week 9 Presentation: Perception for Action (Chapter 7)

Perception for Action (Chapter 7)

Introduction:

Perception is not just for identification; it is for interaction. This topic contrasts the “What” pathway (ventral stream) with the “Where/How” pathway (dorsal stream). It examines how we use visual information to navigate the environment, grasp objects, and coordinate movements, highlighting the concept of “affordances”—perceiving objects in terms of their potential uses.

Brainstorming Questions:

1. **The Zombie Pilot:** specific personal experience required. Pick up a cup without looking directly at it (look at the TV instead). How did your hand know exactly how wide to open? Explain to your grandma that she has a “secret zombie pilot” (the Dorsal Stream) in her brain that handles grabbing and moving, even when her “conscious pilot” (the Ventral Stream) is watching a soap opera.
2. **The Sympathetic Ouch:** specific personal experience required. Watch a video of someone stubbing their toe and feel that “cringe.” Explain to a child why they feel someone else’s pain. Describe “mirror neurons” as tiny copycats in their brain that pretend they are doing exactly what they see, helping us understand others.
3. **The Magic Mirror Trick:** specific personal experience required. Look at yourself in a mirror and switch your gaze from your left eye to your right eye. You never see your eyes move! Explain this to a 6-year-old: tell them their brain “pauses the video” (Saccadic Suppression) every time they move their eyes so the world doesn’t look like a blurry mess, making them the director of their own movie.
